

## Confirming your Mac is obtaining the DNS address automatically

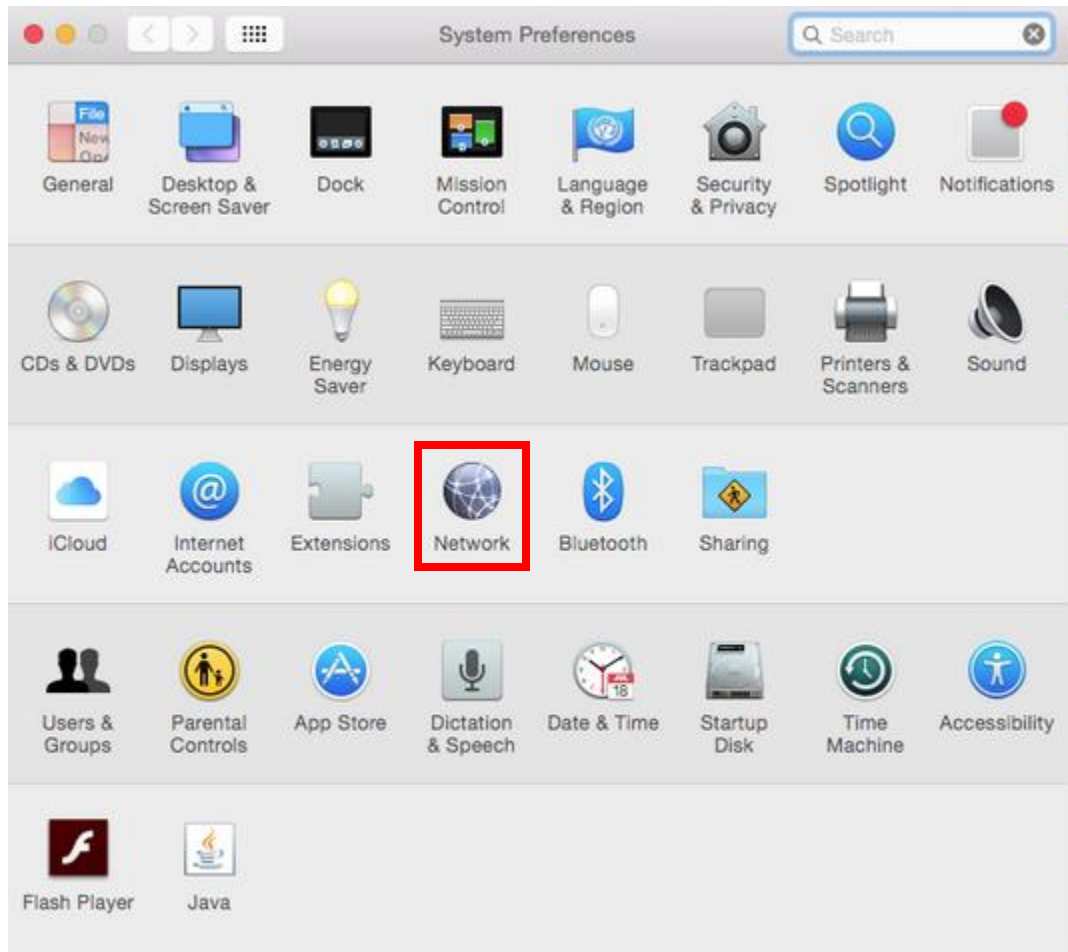

In order for your Mac to connect to UL WiFi we recommend setting the wireless adaptor to obtain a DNS address automatically. Most machines will have this setting turned on by default.

*Below are instructions on how to confirm your Mac is obtaining a DNS address automatically*

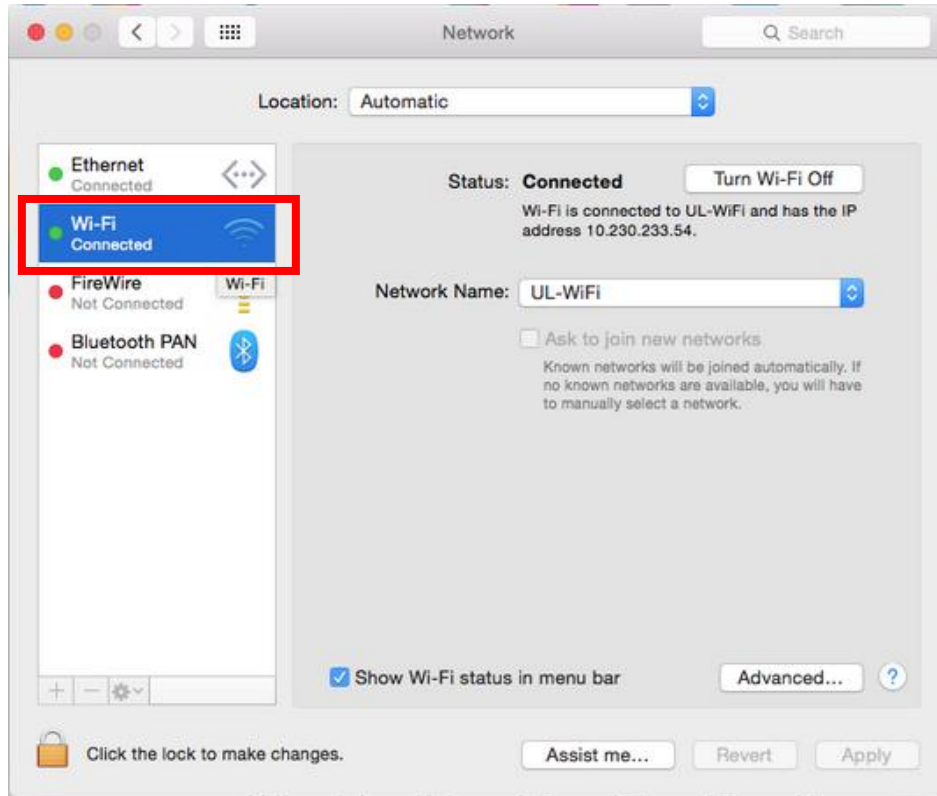

1. Open the **System Preferences**

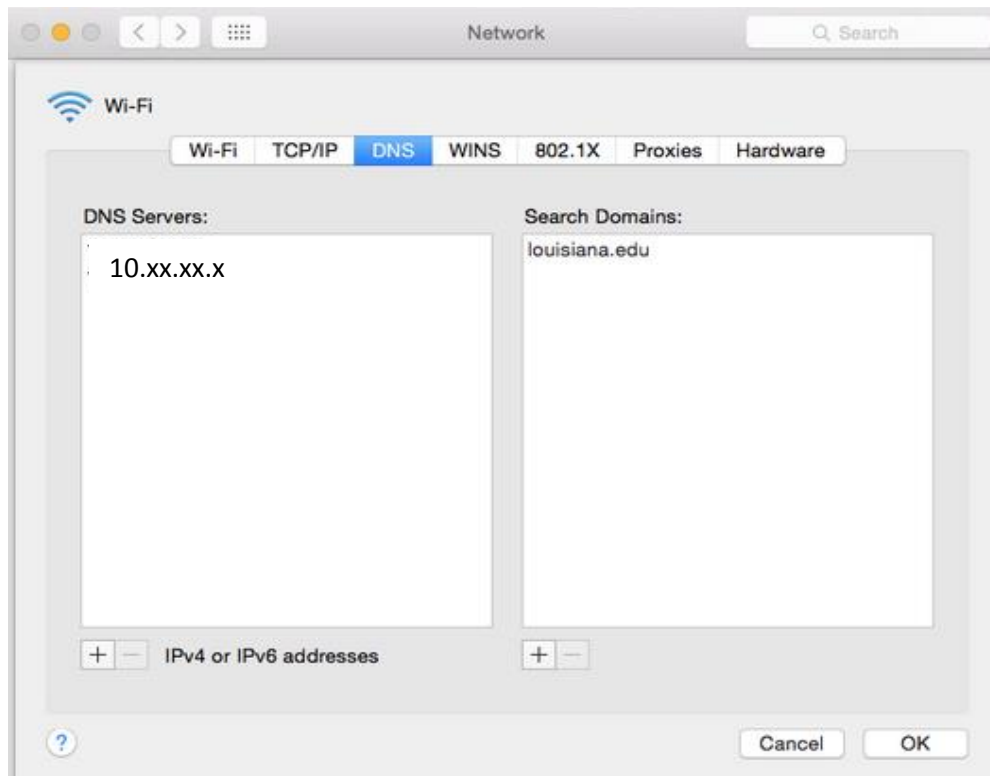

2. Click **Network**

3. Click **Wi-Fi**

4. Confirm the only DNS Servers listed are those with 10.xx.xx.xx addresses. If any other addresses are listed select the address and removed it.

5. It is important the exit each window by clicking Apply or OK (clicking Cancel will cause any changes you made not to save).
